Problem Statement:

While many calendar applications exist, none can accurately and beneficially plan out study session (what to study, when to study, and for how long to study) for you.

Details:

There are many calendar applications that you can use to space out your study sessions, but they rely on you already knowing what to study exactly on those days, and how far apart each session could be. This project would use cognitive science principles to properly space out your study sessions. It would tell you exactly how and what to study on that day, based on previous study sessions, and would also tell you how long to study for and at what time in the day.
